SPERGON

The new outstanding seed treatment by dusting for the prevention of seed born diseases and fungi causing low germination of seed. It is non-poisonous and does not harm the seed under any conditions of soil, moisture or temperature, according to results to date. It can be used for all kinds of seed. You will be pleased and surprised with the results.

DEAR CUSTOMER:

No doubt you have had inquiries about pasture grasses. One of the newer pasture grass is Yellow Blue Stem K.R. Strain. It is this grass and other grasses that we wish to call to your attention this month.

YELLOW BLUE STEM: Yellow Blue Stem is a cousin to the well known native grass, Little Blue Stem. A native of India, there are several strains of this grass, but the K.R. Strain shows a marked improvement over the Common Yellow Blue Stem. It is easily established, is more nutritious to live stock, can stand up better under grazing pressure, makes more growth, is cold resistant, can be harvested for seed more easily, reseeds itself even under adverse conditions and provides better erosion control than other known strains of the Yellow Blue Stem.

Yellow Blue Stem Grass is a tall perennial Blue Stem. The early stems spread out and hug the ground, forming erosion-resisting rosettes. Later growth of stems grow two or three feet tall. Good sized leafy tufts are formed the first year. The tops of the stems turn a pale yellow in the fall. The plants make almost a continuous growth in the mid-southwest.

BOER LOVEGRASS: (Blue Lovegrass) Boer Lovegrass is a long lived, perennial bunch grass. It makes rapid growth, starts stooling early, forms dense clumps and for a given period will produce about one-third fewer vegetative culms than Weeping Lovegrass. The basal leaves, which constitute the bulk of the foliage are rather long, 24 to 36 inches, narrow, slightly rough to the touch, flexible, curving, and characteristically bluish in color. Where it is not too cold, the lower part of the leaves remain green and nondormant over winter.

WEEPING LOVEGRASS: (African Lovegrass) Weeping Lovegrass is a long lived perennial bunch grass, individual specimens of which develop into very large, dense clumps. Growth is rapid and stooling begins within 4 to 6 weeks after planting. Under favorable conditions several hundred closely packed clumps form on the crown the first year. As the plant grows older, offsets commonly form at the nodes for some distance up the stem. These offsets frequently send out aerial roots and establish themselves as new plants in the debris around the crown of the mother plants. The basal leaves are long (24 to 48 inches) slender and curving. They taper to very fine, hairlike brownish threads which often tangle with those of neighboring plants. Noticeably purplish at the base while young, they are generally light green through the succeeding growing season, changing to greyish brown or a reddish shade and becoming somewhat dry and tough in the fall and during severe drought, but remaining green and comparatively soft at the base and in a nondormant condition all winter.

LEHMANN LOVEGRASS: (Mat Lovegrass) Lehmann Lovegrass is a perennial grass, but unlike Weeping or Boer Lovegrass the stems are commonly prostrate and take root and produce new plants at the nodes. The stems are slender, smooth, flexible and from 18 to 36 inches long. While they are fewer in number as they emerge from the crown than in the case of the other Lovegrasses, this is counterbalanced by early and profuse branching and rapid new plant development by layering. The leaves are short, 3 to 6 inches, dark green, smooth and narrow, tapering to a fine straight point. The seed stalks are characteristically numerous and normally attain an average height of about 2 feet. The seed are similar in shape and color to those of Weeping Lovegrass, but about one fourth the size.

BLUE PANIC: A deep-rooted, perennial bunch grass that forms good-sized tough crowns by means of thick, short, bulbous rhizomes. It may reach a height of 6 feet under best growing conditions. The lower half of the stems have large nodes and bony internodes. Branching from the lower nodes is common if the main stem is cut off. The panicles are terminal on the stems and branches.

We are now booking the above mentioned grasses for delivery in September to November 1947, our option. These bookings are made subject to growing crops.
